Propositional and Predicate Logic - VI

WS 2015/2016 1 / 22

Predicate logic

Deals with statements about objects, their properties and relations.

"She is intelligent and her father knows the rector."

- x is a variable, representing an object,
- r is a constant symbol, representing a concrete object,
- f is a function symbol, representing a function,
- *I*, *K* are relation (predicate) symbols, representing relations (the property of *"being intelligent"* and the relation *"to know"*).

"Everybody has a father."

- $(\forall x)$ is the universal quantifier (for every x),
- $(\exists y)$ is the existential quantifier (*there exists* y),
- = is a (binary) relation symbol, representing the identity relation.

 $(\forall x)(\exists y)(y=f(x))$

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

 $I(x) \wedge K(f(x), r)$

Language

A first-order language consists of

- variables $x, y, z, \ldots, x_0, x_1, \ldots$ (countable many), the set of all variables is denoted by Var,
- function symbols f, g, h, \ldots , including constant symbols c, d, \ldots , which are nullary function symbols,
- relation (predicate) symbols P, Q, R, \ldots , eventually the symbol = (equality) as a special relation symbol,
- quantifiers $(\forall x)$, $(\exists x)$ for every variable $x \in Var$,
- logical connectives $\neg, \land, \lor, \rightarrow, \leftrightarrow$
- parentheses (,)

Every function and relation symbol *S* has an associated *arity* $ar(S) \in \mathbb{N}$.

Remark Compared to propositional logic we have no (explicit) propositional variables, but they can be introduced as nullary relation symbols.

・ロト ・回ト ・ヨト ・ヨト … ヨ

Signatures

- *Symbols of logic* are variables, quantifiers, connectives and parentheses.
- *Non-logical symbols* are function and relation symbols except the equality symbol. The equality is (usually) considered separately.
- A signature is a pair (R, F) of disjoint sets of relation and function symbols with associated arities, whereas none of them is the equality symbol. A signature lists all non-logical symbols.
- A *language* is determined by a signature L = (R, F) and by specifying whether it is a language with equality or not. A language must contain at least one relation symbol (non-logical or the equality).

Remark The meaning of symbols in a language is not assigned, e.g. the symbol + does not have to represent the standard addition.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Examples of languages

We describe a language by a list of all non-logical symbols with eventual clarification of arity and whether they are relation or function symbols.

The following examples of languages are all with equality.

- $L = \langle \rangle$ is the language of pure equality,
- $L = \langle c_i \rangle_{i \in \mathbb{N}}$ is the language of countable many constants,
- $L = \langle \leq \rangle$ is the language of orderings,
- $L = \langle E \rangle$ is the language of the graph theory,
- $L = \langle +, -, 0 \rangle$ is the language of the group theory,
- $L = \langle +, -, \cdot, 0, 1 \rangle$ is the language of the field theory,
- $L = \langle -, \wedge, \vee, 0, 1 \rangle$ is the language of Boolean algebras,
- $L = \langle S, +, \cdot, 0, < \rangle$ is the language of arithmetic,

where c_i , 0, 1 are constant symbols, S_i – are unary function symbols,

 $+, \cdot, \wedge, \vee$ are binary function symbols, E, \leq are binary relation symbols.

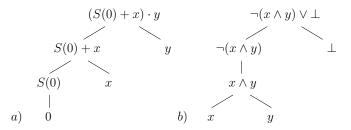

Terms

Are expressions representing values of (composed) functions. Terms of a language L are defined inductively by

- (*i*) every variable or constant symbol in *L* is a term,
- (*ii*) if *f* is a function symbol in *L* of arity n > 0 and t_0, \ldots, t_{n-1} are terms, then also the expression $f(t_0, \ldots, t_{n-1})$ is a term,
- (*iii*) every term is formed by a finite number of steps (*i*), (*ii*).
- A *ground term* is a term with no variables.
- The set of all terms of a language L is denoted by $Term_L$.
- A term that is a part of another term *t* is called a *subterm* of *t*.
- The structure of terms can be represented by their formation trees.
- For binary function symbols we often use infix notation, e.g. we write (x + y) instead of +(x, y).

A D A A B A A B A A B A

Examples of terms

- *a*) The formation tree of the term $(S(0) + x) \cdot y$ of the language of arithmetic.
- b) Propositional formulas only with connectives ¬, ∧, ∨, eventually with constants ⊤, ⊥ can be viewed as terms of the language of Boolean algebras.

Formula

Atomic formulas

Are the simplest formulas.

- An *atomic formula* of a language L is an expression $R(t_0, \ldots, t_{n-1})$ where R is an *n*-ary relation symbol in L and t_0, \ldots, t_{n-1} are terms of L.
- The set of all atomic formulas of a language L is denoted by AFm_L.
- The structure of an atomic formula can be represented by a formation tree from the formation subtrees of its terms.
- For binary relation symbols we often use infix notation, e.g.
 - $t_1 = t_2$ instead of $= (t_1, t_2)$ or $t_1 < t_2$ instead of $< (t_1, t_2)$.
- Examples of atomic formulas

 $K(f(x), r), \quad x \cdot y < (S(0) + x) \cdot y, \quad \neg(x \wedge y) \lor \bot = \bot.$

・ロット (母) ・ ヨ) ・ ヨ)

Formula

Formula

Formulas of a language L are defined inductively by

- (i) every atomic formula is a formula,
- (*ii*) if φ, ψ are formulas, then also the following expressions are formulas $(\neg \varphi), (\varphi \land \psi), (\varphi \lor \psi), (\varphi \to \psi), (\varphi \leftrightarrow \psi), (\varphi$
- (*iii*) if φ is a formula and x is a variable, then also the expressions $((\forall x)\varphi)$ and $((\exists x)\varphi)$ are formulas.
- (iv) every formula is formed by a finite number of steps (i), (ii), (iii).
- The set of all formulas of a language L is denoted by Fm_L.
- A formula that is a part of another formula φ is called a *subformula* of φ .
- The structure of formulas can be represented by their formation trees.

Conventions

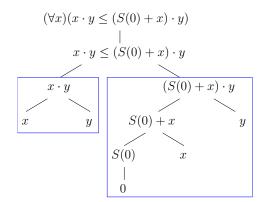

- After introducing *priorities* for binary function symbols e.g. $+, \cdot$ we are in infix notation allowed to omit parentheses that are around a subterm formed by a symbol of higher priority, e.g. $x \cdot y + z$ instead of $(x \cdot y) + z$.
- After introducing priorities for connectives and quantifiers we are allowed to omit parentheses that are around subformulas formed by connectives of higher priority.

$$(1) \quad \rightarrow, \ \leftrightarrow \qquad (2) \quad \wedge, \ \lor \qquad (3) \quad \neg, \ (\forall x), \ (\exists x)$$

- They can be always omitted around subformulas formed by \neg , $(\forall x)$, $(\exists x)$.
- We may also omit parentheses in $(\forall x)$ and $(\exists x)$ for every $x \in Var$.
- The outer parentheses may be omitted as well.

 $(((\neg((\forall x)R(x))) \land ((\exists y)P(y))) \rightarrow (\neg(((\forall x)R(x)) \lor (\neg((\exists y)P(y))))))$ $\neg \forall x R(x) \land \exists y P(y) \rightarrow \neg (\forall x R(x) \lor \neg \exists y P(y))$

An example of a formula

The formation tree of the formula $(\forall x)(x \cdot y \leq (S(0) + x) \cdot y)$.

Occurrences of variables

Let φ be a formula and *x* be a variable.

- An *occurrence* of *x* in φ is a leaf labeled by *x* in the formation tree of φ .
- An occurrence of x in φ is *bound* if it is in some subformula ψ that starts with (∀x) or (∃x). An occurrence of x in φ is *free* if it is not bound.
- A variable x is *free* in φ if it has at least one free occurrence in φ.
 It is *bound* in φ if it has at least one bound occurrence in φ.
- A variable x can be both free and bound in φ . For example in

 $(\forall x)(\exists y)(x \leq y) \lor x \leq z.$

 We write φ(x₁,...,x_n) to denote that x₁,..., x_n are all free variables in the formula φ. (φ states something about these variables.)

Remark We will see that the truth value of a formula (in a given interpretation of symbols) depends only on the assignment of free variables.

・ロト ・回 ・ ・ ヨ ・ ・ ヨ ・

Open and closed formulas

- A formula is *open* if it is without quantifiers. For the set OFm_L of all open formulas in a language *L* it holds that $AFm_L \subsetneq OFm_L \subsetneq Fm_L$.
- A formula is *closed* (a *sentence*) if it has no free variable; that is, all occurrences of variables are bound.
- A formula can be both open and closed. In this case, all its terms are ground terms.

 $\begin{array}{ll} x+y \leq 0 & \textit{open}, \varphi(x,y) \\ (\forall x)(\forall y)(x+y \leq 0) & \textit{a sentence}, \\ (\forall x)(x+y \leq 0) & \textit{neither open nor a sentence}, \varphi(y) \\ 1+0 \leq 0 & \textit{open sentence} \end{array}$

Remark We will see that in a fixed interpretation of symbols a sentence has a fixed truth value; that is, it does not depend on the assignment of variables.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Instances

After substituting a term t for a free variable x in a formula φ , we would expect that the new formula (newly) says about t "the same" as φ did about x.

 $\begin{aligned} \varphi(x) & (\exists y)(x+y=1) & \text{``there is an element } 1-x" \\ \text{for } t = 1 \text{ we can } \varphi(x/t) & (\exists y)(1+y=1) & \text{``there is an element } 1-1" \\ \text{for } t = y \text{ we cannot} & (\exists y)(y+y=1) & \text{``1 is divisible by } 2" \end{aligned}$

- A term *t* is *substitutable* for a variable *x* in a formula φ if substituting *t* for all free occurrences of *x* in φ does not introduce a new bound occurrence of a variable from *t*.
- Then we denote the obtained formula φ(x/t) and we call it an *instance* of the formula φ after a *substitution* of a term t for a variable x.
- *t* is not substitutable for *x* in φ if and only if *x* has a free occurrence in some subformula that starts with (∀y) or (∃y) for some variable y in t.
- Ground terms are always substitutable.

・ロト ・回 ・ ・ ヨ ・ ・ ヨ ・

Variants

Quantified variables can be (under certain conditions) renamed so that we obtain an equivalent formula.

Let $(Qx)\psi$ be a subformula of φ where Q means \forall or \exists and y is a variable such that the following conditions hold.

- 1) *y* is substitutable for *x* in ψ , and
- 2) y does not have a free occurrence in ψ .

Then by replacing the subformula $(Qx)\psi$ with $(Qy)\psi(x/y)$ we obtain a *variant* of φ *in subformula* $(Qx)\psi$. After variation of one or more subformulas in φ we obtain a *variant* of φ . *For example,*

$(\exists x)(\forall y)(x \le y)$
$(\exists u)(\forall v)(u \leq v)$
$(\exists y)(\forall y)(y \le y)$
$(\exists x)(\forall x)(x \le x)$

is a formula φ , is a variant of φ , is not a variant of φ , 1) does not hold, is not a variant of φ , 2) does not hold.

Structures

- <u>S</u> = ⟨S, ≤⟩ is an ordered set where ≤ is reflexive, antisymmetric, transitive binary relation on S,
- G = ⟨V, E⟩ is an undirected graph without loops where V is the set of vertices and E is irreflexive, symmetric binary relation on V (adjacency),
- $\underline{\mathbb{Z}}_p = \langle \mathbb{Z}_p, +, -, 0 \rangle$ is the additive group of integers modulo p,
- $\mathbb{Q} = \langle \mathbb{Q}, +, -, \cdot, 0, 1 \rangle$ is the field of rational numbers,
- $\mathcal{P}(X) = \langle \mathcal{P}(X), -, \cap, \cup, \emptyset, X \rangle$ is the set algebra over X,
- $\underline{\mathbb{N}} = \langle \mathbb{N}, S, +, \cdot, 0, \leq \rangle$ is the standard model of arithmetic,
- finite automata and other models of computation,
- relational databases, ...

A structure for a language

Let $L = \langle \mathcal{R}, \mathcal{F} \rangle$ be a signature of a language and A be a nonempty set.

- A realization (interpretation) of a relation symbol $R \in \mathcal{R}$ on A is any relation $R^A \subseteq A^{\operatorname{ar}(R)}$. A realization of = on A is the relation Id_A (identity).
- A realization (interpretation) of a function symbol $f \in \mathcal{F}$ on A is any function $f^A: A^{\operatorname{ar}(f)} \to A$. Thus a realization of a constant symbol is some element of A.

A *structure* for the language *L* (*L*-*structure*) is a triple $\mathcal{A} = \langle A, \mathcal{R}^A, \mathcal{F}^A \rangle$, where

- A is nonempty set, called the *domain* of the structure \mathcal{A} ,
- $\mathcal{R}^A = \langle R^A | R \in \mathcal{R} \rangle$ is a collection of realizations of relation symbols,
- $\mathcal{F}^A = \langle f^A \mid f \in \mathcal{F} \rangle$ is a collection of realizations of function symbols.

A structure for the language L is also called a *model of the language L*. The class of all models of L is denoted by M(L). Examples for $L = \langle \langle \rangle$ are

 $\langle \mathbb{N}, < \rangle, \langle \mathbb{Q}, > \rangle, \langle X, E \rangle, \langle \mathcal{P}(X), \subseteq \rangle.$

Value of terms

Let *t* be a term of $L = \langle \mathcal{R}, \mathcal{F} \rangle$ and $\mathcal{A} = \langle A, \mathcal{R}^A, \mathcal{F}^A \rangle$ be an *L*-structure.

- A *variable assignment* over the domain A is a function $e: Var \rightarrow A$.
- The *value* $t^{A}[e]$ of the term *t* in the structure A with respect to the assignment *e* is defined by

 $x^{A}[e] = e(x)$ for every $x \in Var$,

 $(f(t_0,\ldots,t_{n-1}))^A[e]=f^A(t_0^A[e],\ldots,t_{n-1}^A[e]) \quad \text{for every } f\in\mathcal{F}.$

- In particular, for a constant symbol c we have $c^{A}[e] = c^{A}$.
- If *t* is a ground term, its value in *A* is independent on the assignment *e*.
- The value of t in A depends only on the assignment of variables in t.

For example, the value of the term x + 1 in the structure $\mathcal{N} = \langle \mathbb{N}, +, 1 \rangle$ with respect to the assignment *e* with e(x) = 2 is $(x + 1)^N[e] = 3$.

Truth values

Values of atomic formulas

Let φ be an atomic formula of $L = \langle \mathcal{R}, \mathcal{F} \rangle$ in the form $R(t_0, \ldots, t_{n-1})$,

- $\mathcal{A} = \langle A, \mathcal{R}^A, \mathcal{F}^A \rangle$ be an *L*-structure, and *e* be a variable assignment over *A*.
 - The value $H^A_{at}(\varphi)[e]$ of the formula φ in the structure \mathcal{A} with respect to e is

 $H_{at}^{A}(R(t_{0},...,t_{n-1}))[e] = \begin{cases} 1 & \text{if } (t_{0}^{A}[e],...,t_{n-1}^{A}[e]) \in R^{A}, \\ 0 & \text{otherwise.} \end{cases}$ where $=^{A}$ is Id_A; that is, $H_{at}^{A}(t_{0} = t_{1})[e] = 1$ if $t_{0}^{A}[e] = t_{1}^{A}[e]$, and $H_{at}^A(t_0 = t_1)[e] = 0$ otherwise.

- If φ is a sentence; that is, all its terms are ground, then its value in \mathcal{A} is independent on the assignment e.
- The value of φ in \mathcal{A} depends only on the assignment of variables in φ .

For example, the value of φ in form $x + 1 \leq 1$ in $\mathcal{N} = \langle \mathbb{N}, +, 1, < \rangle$ with respect to the assignment *e* is $H_{at}^N(\varphi)[e] = 1$ if and only if e(x) = 0.

Values of formulas

The value $H^{A}(\varphi)[e]$ of the formula φ in the structure \mathcal{A} with respect to e is

 $H^{A}(\varphi)[e] = H^{A}_{at}(\varphi)[e]$ if φ is atomic, $H^{A}(\neg \varphi)[e] = -1(H^{A}(\varphi)[e])$ $H^{A}(\varphi \wedge \psi)[e] = \wedge_{1}(H^{A}(\varphi)[e], H^{A}(\psi)[e])$ $H^{A}(\varphi \lor \psi)[e] = \lor_{1}(H^{A}(\varphi)[e], H^{A}(\psi)[e])$ $H^{A}(\varphi \rightarrow \psi)[e] = \rightarrow_{1} (H^{A}(\varphi)[e], H^{A}(\psi)[e])$ $H^{A}(\varphi \leftrightarrow \psi)[e] = \leftrightarrow_{1} (H^{A}(\varphi)[e], H^{A}(\psi)[e])$ $H^{A}((\forall x)\varphi)[e] = \min_{a \in A}(H^{A}(\varphi)[e(x/a)])$ $H^{A}((\exists x)\varphi)[e] = \max_{a \in A}(H^{A}(\varphi)[e(x/a)])$

where $-1, \wedge_1, \vee_1, \rightarrow_1, \leftrightarrow_1$ are the Boolean functions given by the tables and e(x/a) for $a \in A$ denotes the assignment obtained from e by setting e(x) = a. **Observation** $H^{A}(\varphi)[e]$ depends only on the assignment of free variables in φ .

• □ ▶ • • □ ▶ • □ ▶ • □ ▶

Satisfiability with respect to assignments

The structure \mathcal{A} satisfies the formula φ with assignment e if $H^A(\varphi)[e] = 1$. Then we write $\mathcal{A} \models \varphi[e]$, and $\mathcal{A} \not\models \varphi[e]$ otherwise. It holds that

Observation Let term t be substitutable for x in φ and ψ be a variant of φ . Then for every structure A and assignment e

1)
$$\mathcal{A} \models \varphi(x/t)[e]$$
 if and only if $\mathcal{A} \models \varphi[e(x/a)]$ where $a = t^{A}[e]$,

2)
$$\mathcal{A} \models \varphi[e]$$
 if and only if $\mathcal{A} \models \psi[e]$.

Validity in a structure

Let φ be a formula of a language L and A be an L-structure.

- φ is *valid* (*true*) *in the structure* A, denoted by A ⊨ φ, if A ⊨ φ[e] for every e: Var → A. We say that A satisfies φ. Otherwise, we write A ⊭ φ.
- φ is *contradictory in* \mathcal{A} if $\mathcal{A} \models \neg \varphi$; that is, $\mathcal{A} \not\models \varphi[e]$ for every $e \colon \text{Var} \to A$.
- For every formulas φ , ψ , variable x, and structure \mathcal{A}

(1)	$\mathcal{A}\models\varphi$	\Rightarrow	$\mathcal{A} \not\models \neg \varphi$
(2)	$\mathcal{A}\models\varphi\wedge\psi$	\Leftrightarrow	$\mathcal{A}\models \varphi$ and $\mathcal{A}\models \psi$
(3)	$\mathcal{A}\models\varphi\lor\psi$	\Leftarrow	$\mathcal{A}\models arphi$ or $\mathcal{A}\models \psi$
(4)	$\mathcal{A}\models\varphi$	\Leftrightarrow	$\mathcal{A} \models (\forall x) \varphi$

- If φ is a sentence, it is valid or contradictory in A, and thus (1) holds also in ⇐. If moreover ψ is a sentence, also (3) holds in ⇒.
- By (4), $\mathcal{A} \models \varphi$ if and only if $\mathcal{A} \models \psi$ where ψ is a *universal closure* of φ , i.e. a formula $(\forall x_1) \cdots (\forall x_n) \varphi$ where x_1, \ldots, x_n are all free variables in φ .
