#### Introduction

### Tableau method in propositional logic - a review

- A tableau is a binary tree that represents a search for a counterexample.
- Nodes are labeled by entries, i.e. formulas with a sign T / F that represents an assumption that the formula is true / false in some model.
- If this assumption is correct, then it is correct also for all the entries in some branch below that came from this entry.
- A branch is contradictory (it fails) if it contains  $T\psi$ ,  $F\psi$  for some  $\psi$ .
- A proof of formula  $\varphi$  is a contradictory tableau with root  $F\varphi$ , i.e. a tableau in which every branch is contradictory. If  $\varphi$  has a proof, it is valid.
- If a counterexample exists, there will be a branch in a finished tableau that provides us with this counterexample, but this branch can be infinite.
- We can construct a systematic tableau that is always finished.
- If  $\varphi$  is valid, the systematic tableau for  $\varphi$  is contradictory, i.e. it is a proof of  $\varphi$ ; and in this case, it is also finite.

## Tableau method in propositional logic - examples

- *a*) A tableau proof of the formula  $((p \rightarrow q) \rightarrow p) \rightarrow p$ .
- *b*) A finished tableau for  $(\neg q \lor p) \rightarrow p$ . The left branch provides us with a counterexample v(p) = v(q) = 0.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

## Tableau method in predicate logic - what is different

- Formulas in entries will always be sentences (closed formulas), i.e. formulas without free variables.
- We add new atomic tableaux for quantifiers.
- In these tableaux we substitute ground terms for quantified variables following certain rules.
- We extend the language by new (auxiliary) constant symbols (countably many) to represent *"witnesses"* of entries  $T(\exists x)\varphi(x)$  and  $F(\forall x)\varphi(x)$ .
- In a finished noncontradictory branch containing an entry  $T(\forall x)\varphi(x)$  or  $F(\exists x)\varphi(x)$  we have instances  $T\varphi(x/t)$  resp.  $F\varphi(x/t)$  for every ground term t (of the extended language).

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

### Assumptions

1) The formula  $\varphi$  that we want to prove (or refute) is a sentence. If not, we can replace  $\varphi$  with its universal closure  $\varphi'$ , since for every theory *T*,

 $T \models \varphi$  if and only if  $T \models \varphi'$ .

 We prove from a theory in a closed form, i.e. every axiom is a sentence. By replacing every axiom ψ with its universal closure ψ' we obtain an equivalent theory since for every structure A (of the given language L),

 $\mathcal{A} \models \psi$  if and only if  $\mathcal{A} \models \psi'$ .

- 3) The language *L* is countable. Then every theory of *L* is countable. We denote by  $L_C$  the extension of *L* by new constant symbols  $c_0, c_1, \ldots$  (countably many). Then there are countably many ground terms of  $L_C$ . Let  $t_i$  denote the *i*-th ground term (in some fixed enumeration).
- 4) First, we assume that the language is without equality.

### Tableaux in predicate logic - examples

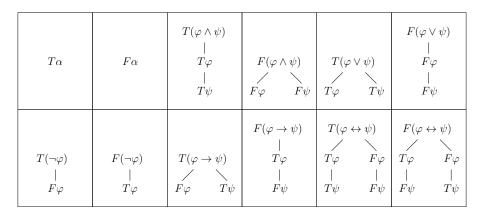

$$\begin{array}{cccc} F((\exists x) \neg P(x) \rightarrow \neg (\forall x) P(x)) & F(\neg (\forall x) P(x) \rightarrow (\exists x) \neg P(x)) \\ & & & & | \\ T(\exists x) \neg P(x) & T(\neg (\forall x) P(x)) \\ & & & | \\ F(\neg (\forall x) P(x)) & F(\exists x) \neg P(x) \\ & & & | \\ T(\forall x) P(x) & F(\forall x) P(x) \\ & & & | \\ T(\neg P(c)) & c & \text{new} & FP(d) & d & \text{new} \\ & & & | \\ FP(c) & F(\exists x) \neg P(x) \\ & & & | \\ T(\forall x) P(x) & F(\neg P(d)) \\ & & & | \\ & & & \otimes \\ \end{array}$$

Image: A math a math

## Atomic tableaux - previous

An *atomic tableau* is one of the following trees (labeled by entries), where  $\alpha$  is any atomic sentence and  $\varphi$ ,  $\psi$  are any sentences, all of language  $L_C$ .

<ロ> <同> <同> < 回> < 回> < 回> = 三

### Atomic tableaux - new

Atomic tableaux are also the following trees (labeled by entries), where  $\varphi$  is any formula of the language  $L_c$  with a free variable x, t is any ground term of  $L_C$  and c is a new constant symbol from  $L_C \setminus L$ .

$ \stackrel{\sharp}{=} T(\forall x)\varphi(x) $	$ * F(\forall x)\varphi(x) $	$* T(\exists x)\varphi(x)$	$\stackrel{\sharp}{=} F(\exists x)\varphi(x)$
 $T\varphi(x/t)$	$F\varphi(x/c)$	 $T\varphi(x/c)$	 $F\varphi(x/t)$
for any ground term $t$ of $L_C$	for a $new$ constant $c$	for a $new$ constant $c$	for any ground term $t$ of $L_C$

**Remark** The constant symbol c represents a "witness" of the entry  $T(\exists x)\varphi(x)$ or  $F(\forall x)\varphi(x)$ . Since we need that no prior demands are put on c, we specify (in the definition of a tableau) which constant symbols c may be used.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

### Tableau

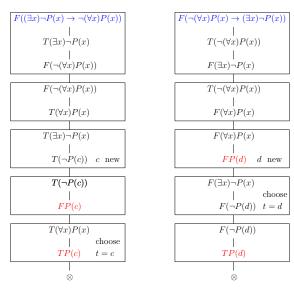

A *finite tableau* from a theory T is a binary tree labeled with entries described

- (*i*) every atomic tableau is a finite tableau from *T*, whereas in case (\*) we may use any constant symbol  $c \in L_C \setminus L$ ,
- (*ii*) if *P* is an entry on a branch *V* in a finite tableau from *T*, then by adjoining the atomic tableau for *P* at the end of branch *V* we obtain (again) a finite tableau from *T*, whereas in case (\*) we may use only a constant symbol  $c \in L_C \setminus L$  that does not appear on *V*,
- (*iii*) if *V* is a branch in a finite tableau from *T* and  $\varphi \in T$ , then by adjoining  $T\varphi$  at the end of branch *V* we obtain (again) a finite tableau from *T*.

(iv) every finite tableau from T is formed by finitely many steps (i), (ii), (iii).

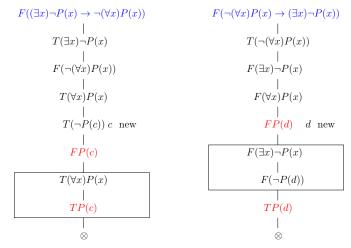

A *tableau* from *T* is a sequence  $\tau_0, \tau_1, \ldots, \tau_n, \ldots$  of finite tableaux from *T* such that  $\tau_{n+1}$  is formed from  $\tau_n$  by (*ii*) or (*iii*), formally  $\tau = \cup \tau_n$ .

### Construction of tableaux

イロト イヨト イヨト イヨト

### Convention

We will not write the entry that is expanded again on the branch, except in cases when the entry is in the form of  $T(\forall x)\varphi(x)$  or  $F(\exists x)\varphi(x)$ .

#### Proof

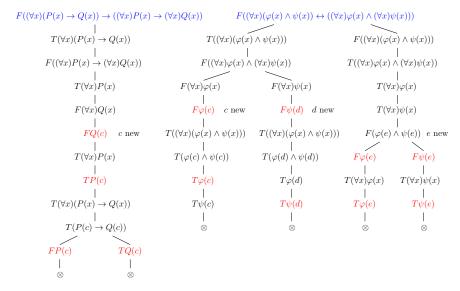

## Tableau proof

- A branch V in a tableau  $\tau$  is *contradictory* if it contains entries  $T\varphi$  and  $F\varphi$ for some sentence  $\varphi$ , otherwise V is *noncontradictory*.
- A tableau τ is contradictory if every branch in τ is contradictory.
- A *tableau proof* (*proof by tableau*) of a sentence  $\varphi$  from a theory T is a contradictory tableau from T with  $F\varphi$  in the root.
- A sentence  $\varphi$  is (tableau) provable from T, denoted by  $T \vdash \varphi$ , if it has a tableau proof from T.
- A *refutation* of a sentence  $\varphi$  by *tableau* from a theory T is a contradictory tableau from T with the root entry  $T\varphi$ .
- A sentence  $\varphi$  is (tableau) refutable from T if it has a refutation by tableau from T, i.e.  $T \vdash \neg \varphi$ .

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

#### Proof

## Finished tableau

A finished noncontradictory branch should provide us with a counterexample. An occurrence of an entry *P* in a node *v* of a tableau  $\tau$  is *i*-th if *v* has exactly i-1 predecessors labeled by *P*; and is *reduced* on a branch *V* through *v* if

- *a*) *P* is neither in form of  $T(\forall x)\varphi(x)$  nor  $F(\exists x)\varphi(x)$  and *P* occurs on *V* as a root of an atomic tableau, i.e. it was already expanded on *V*, or
- *b) P* is in form of  $T(\forall x)\varphi(x)$  or  $F(\exists x)\varphi(x)$ , *P* has an (i + 1)-th occurrence on *V*, and *V* contains an entry  $T\varphi(x/t_i)$  resp.  $F\varphi(x/t_i)$  where  $t_i$  is the *i*-th ground term (of the language  $L_C$ ).
- Let V be a branch in a tableau  $\tau$  from a theory T. We say that
  - V is *finished* if it is contradictory, or every occurrence of an entry on V is reduced on V and, moreover, V contains Tφ for every φ ∈ T,
  - $\tau$  is *finished* if every branch in  $\tau$  is finished.

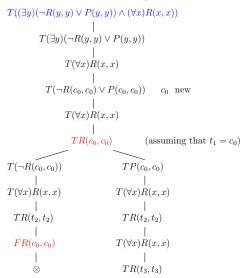

## Systematic tableau - construction

Let *R* be an entry and  $T = \{\varphi_0, \varphi_1, \dots\}$  be a (possibly infinite) theory.

- (1) We take the atomic tableau for *R* as  $\tau_0$ . In case (\*) we choose any  $c \in L_C \setminus L$ , in case ( $\sharp$ ) we take  $t_1$  for *t*. Till possible, proceed as follows.
- (2) Let *v* be the leftmost node in the smallest level as possible in tableau  $\tau_n$  containing an occurrence of an entry *P* that is not reduced on some noncontradictory branch through *v*. (If *v* does not exist, we take  $\tau'_n = \tau_n$ .)
- (3*a*) If *P* is neither  $T(\forall x)\varphi(x)$  nor  $F(\exists x)\varphi(x)$ , let  $\tau'_n$  be the tableau obtained from  $\tau_n$  by adjoining the atomic tableau for *P* to every noncontradictory branch through  $\nu$ . In case (\*) we choose  $c_i$  for the smallest possible *i*.
- (3b) If *P* is  $T(\forall x)\varphi(x)$  or  $F(\exists x)\varphi(x)$  and it has *i*-th occurrence in v, let  $\tau'_n$  be the tableau obtained from  $\tau_n$  by adjoining atomic tableau for *P* to every noncontradictory branch through v, where we take the term  $t_i$  for *t*.
  - (4) Let  $\tau_{n+1}$  be the tableau obtained from  $\tau'_n$  by adjoining  $T\varphi_n$  to every noncontradictory branch that does not contain  $T\varphi_n$  yet. (If  $\varphi_n$  does not exist, we take  $\tau_{n+1} = \tau'_n$ .)

The systematic tableau for R from T is the result  $\tau = \bigcup \tau_n$  of this construction,

### Systematic tableau - an example

4 3 4 4 3

### Systematic tableau - being finished

**Proposition** Every systematic tableau is finished. *Proof* Let  $\tau = \bigcup \tau_n$  be a systematic tableau from  $T = \{\varphi_0, \varphi_1, \dots\}$  with root *R* and let *P* be an entry in a node *v* of the tableau  $\tau$ .

- There are only finitely many entries in  $\tau$  in levels up to the level of v.
- If the occurrence of *P* in *ν* was unreduced on some noncontradictory branch in *τ*, it would be found in some step (2) and reduced by (3*a*), (3*b*).
- By step (4) every  $\varphi_n \in T$  will be (no later than) in  $\tau_{n+1}$  on every noncontradictory branch.
- Hence the systematic tableau au has all branches finished.  $\ \Box$

**Proposition** If a systematic tableau  $\tau$  is a proof (from a theory *T*), it is finite. *Proof* Suppose that  $\tau$  is infinite. Then by König's lemma,  $\tau$  contains an infinite branch. This branch is noncontradictory since in the construction only noncontradictory branches are prolonged. But this contradicts the assumption that  $\tau$  is a contradictory tableau.

## Equality

Axioms of equality for a language L with equality are

(*i*) x = x

(*ii*)  $x_1 = y_1 \land \cdots \land x_n = y_n \rightarrow f(x_1, \ldots, x_n) = f(y_1, \ldots, y_n)$ 

for each n-ary function symbol f of the language L.

(*iii*)  $x_1 = y_1 \land \cdots \land x_n = y_n \rightarrow (R(x_1, \ldots, x_n) \rightarrow R(y_1, \ldots, y_n))$ for each *n*-ary relation symbol *R* of the language *L* including =.

A *tableau proof* from a theory T in a language L with equality is a tableau proof from  $T^*$  where  $T^*$  denotes the extension of T by adding axioms of equality for L (resp. their universal closures).

*Remark* In context of logic programming the equality often has other meaning than in mathematics (identity). For example in Prolog,  $t_1 = t_2$  means that  $t_1$  and  $t_2$  are unifiable.

# Congruence and guotient structure

Let  $\sim$  be an equivalence on  $A, f: A^n \to A$ , and  $R \subseteq A^n$  for  $n \in \mathbb{N}$ . Then  $\sim$  is

• a congruence for the function f if for every  $x_1, \ldots, x_n, y_1, \ldots, y_n \in A$ 

 $x_1 \sim y_1 \land \cdots \land x_n \sim y_n \Rightarrow f(x_1, \ldots, x_n) \sim f(y_1, \ldots, y_n),$ 

• a congruence for the relation *R* if for every  $x_1, \ldots, x_n, y_1, \ldots, y_n \in A$  $x_1 \sim y_1 \wedge \cdots \wedge x_n \sim y_n \quad \Rightarrow \quad (R(x_1, \ldots, x_n) \Leftrightarrow R(y_1, \ldots, y_n)).$ 

Let an equivalence  $\sim$  on A be a congruence for every function and relation in a structure  $\mathcal{A} = \langle A, \mathcal{F}^A, \mathcal{R}^A \rangle$  of language  $L = \langle \mathcal{F}, \mathcal{R} \rangle$ . Then the *quotient* (*structure*) of  $\mathcal{A}$  by  $\sim$  is the structure  $\mathcal{A}/\sim = \langle A/\sim, \mathcal{F}^{A/\sim}, \mathcal{R}^{A/\sim} \rangle$  where

$$f^{A/\sim}([x_1]_{\sim},\ldots,[x_n]_{\sim}) = [f^A(x_1,\ldots,x_n)]_{\sim}$$
$$R^{A/\sim}([x_1]_{\sim},\ldots,[x_n]_{\sim}) \Leftrightarrow R^A(x_1,\ldots,x_n)$$

for each  $f \in \mathcal{F}$ ,  $R \in \mathcal{R}$ , and  $x_1, \ldots, x_n \in A$ , i.e. the functions and relations are defined from  $\mathcal{A}$  using representatives.

*Example*:  $\underline{\mathbb{Z}}_p$  is the quotient of  $\underline{\mathbb{Z}} = \langle \mathbb{Z}, +, -, 0 \rangle$  by the congruence modulo p.

## Role of axioms of equality

Let  $\mathcal{A}$  be a structure of a language L in which the equality is interpreted as a relation  $=^{A}$  satisfying the axioms of equality for L, i.e. not necessarily the identity relation.

- 1) From axioms (*i*) and (*iii*) it follows that the relation  $=^{A}$  is an equivalence.
- 2) Axioms (*ii*) and (*iii*) express that the relation  $=^{A}$  is a congruence for every function and relation in A.
- 3) If  $\mathcal{A} \models T^*$  then also  $(\mathcal{A}/=^A) \models T^*$  where  $\mathcal{A}/=^A$  is the quotient of  $\mathcal{A}$  by
  - $=^{A}$ . Moreover, the equality is interpreted in  $\mathcal{A}/=^{A}$  as the identity relation.

On the other hand, in every model in which the equality is interpreted as the identity relation, all axioms of equality evidently hold.

### Soundness

We say that a model  $\mathcal{A}$  *agrees* with an entry *P*, if *P* is  $T\varphi$  and  $\mathcal{A} \models \varphi$  or if *P* is  $F\varphi$  and  $\mathcal{A} \models \neg \varphi$ , i.e.  $\mathcal{A} \not\models \varphi$ . Moreover,  $\mathcal{A}$  *agrees* with a branch *V* if  $\mathcal{A}$  agrees with every entry on *V*.

**Lemma** Let A be a model of a theory T of a language L that agrees with the root entry R in a tableau  $\tau = \bigcup \tau_n$  from T. Then A can be expanded to the language  $L_C$  so that it agrees with some branch V in  $\tau$ .

*Remark* It suffices to expand A only by constants  $c^A$  such that  $c \in L_C \setminus L$  occurs on V, other constants may be defined arbitrarily.

*Proof* By induction on *n* we find a branch  $V_n$  in  $\tau_n$  and an expansion  $A_n$  of A by constants  $c^A$  for all  $c \in L_C \setminus L$  on  $V_n$  s.t.  $A_n$  agrees with  $V_n$  and  $V_{n-1} \subseteq V_n$ .

Assume we have a branch  $V_n$  in  $\tau_n$  and an expansion  $\mathcal{A}_n$  that agrees with  $V_n$ .

- If  $\tau_{n+1}$  is formed from  $\tau_n$  without extending the branch  $V_n$ , we take  $V_{n+1} = V_n$  and  $A_{n+1} = A_n$ .
- If  $\tau_{n+1}$  is formed from  $\tau_n$  by appending  $T\varphi$  to  $V_n$  for some  $\varphi \in T$ , let  $V_{n+1}$  be this branch and  $\mathcal{A}_{n+1} = \mathcal{A}_n$ . Since  $\mathcal{A} \models \varphi, \mathcal{A}_{n+1}$  agrees with  $V_{n+1}$ .

#### Soundness

# Soundness - proof (cont.)

- Otherwise  $\tau_{n+1}$  is formed from  $\tau_n$  by appending an atomic tableau to  $V_n$ for some entry P on  $V_n$ . By induction we know that  $\mathcal{A}_n$  agrees with P.
- (i) If P is formed by a logical connective, we take  $A_{n+1} = A_n$  and verify that  $V_n$  can always be extended to a branch  $V_{n+1}$  agreeing with  $A_{n+1}$ .
- (*ii*) If P is in form  $T(\forall x)\varphi(x)$ , let  $V_{n+1}$  be the (unique) extension of  $V_n$  to a branch in  $\tau_{n+1}$ , i.e. by the entry  $T\varphi(x/t)$ . Let  $\mathcal{A}_{n+1}$  be any expansion of by new constants from t. Since  $\mathcal{A}_n \models (\forall x)\varphi(x)$ , we have  $\mathcal{A}_{n+1} \models \varphi(x/t)$ . Analogously for *P* in form  $F(\exists x)\varphi(x)$ .
- (*iii*) If P is in form  $T(\exists x)\varphi(x)$ , let  $V_{n+1}$  be the (unique) extension of  $V_n$  to a branch in  $\tau_{n+1}$ , i.e. by the entry  $T\varphi(x/c)$ . Since  $\mathcal{A}_n \models (\exists x)\varphi(x)$ , there is some  $a \in A$  with  $\mathcal{A}_n \models \varphi(x)[e(x/a)]$  for every assignment *e*. Let  $\mathcal{A}_{n+1}$  be the expansion of  $\mathcal{A}_n$  by a new constant  $c^A = a$ . Then  $\mathcal{A}_{n+1} \models \varphi(x/c)$ . Analogously for *P* in form  $F(\forall x)\varphi(x)$ .

The base step for n = 0 follows from similar analysis of atomic tableaux for the root entry R applying the assumption that A agrees with R.

### Theorem on soundness

We will show that the tableau method in predicate logic is sound.

**Theorem** For every theory *T* and sentence  $\varphi$ , if  $\varphi$  is tableau provable from *T*, then  $\varphi$  is valid in *T*, i.e.  $T \vdash \varphi \Rightarrow T \models \varphi$ .

Proof

- Let  $\varphi$  be tableau provable from a theory *T*, i.e. there is a contradictory tableau  $\tau$  from *T* with the root entry  $F\varphi$ .
- Suppose for a contradiction that φ is not valid in *T*, i.e. there exists a model A of the theory *T* in which φ is not true (a counterexample).
- Since A agrees with the root entry *F*φ, by the previous lemma, A can be expanded to the language *L<sub>C</sub>* so that it agrees with some branch in *τ*.
- But this is impossible, since every branch of  $\tau$  is contradictory, i.e. it contains a pair of entries  $T\psi$ ,  $F\psi$  for some sentence  $\psi$ .
