• Explain the difference between atomic and factored representations of states using *N*-queens problem.

イロト イボト イヨト イヨト

 Explain the difference between atomic and factored representations of states using *N*-queens problem.
 atomic: non-divisible, start state, transition model, goal node(s)
 factored: vector of values (positions of queens)

イロト イボト イヨト イヨト

- Explain the difference between atomic and factored representations of states using *N*-queens problem.
 atomic: non-divisible, start state, transition model, goal node(s)
 factored: vector of values (positions of queens)
- What is the difference between search node and state? Is it the same?

- Explain the difference between atomic and factored representations of states using *N*-queens problem.
 atomic: non-divisible, start state, transition model, goal node(s)
 factored: vector of values (positions of queens)
- What is the difference between search node and state? Is it the same? State - representation of physical configuration. Search node - data structure, two different search nodes may correspond to one state

• Discuss various abstractions for N-queens problem. Hint: look at the size of search space.

イロト イロト イヨト イ

Sac

• Discuss various abstractions for N-queens problem. Hint: look at the size of search space.

basic:

- 1 States: coordinates of queens on board
- 2 Initial state: empty board
- ③ Goal state: test that all queens are on the board and do not attack each other
- 4 Search space size: $(n \times n)^n$

• Discuss various abstractions for N-queens problem. Hint: look at the size of search space.

basic:

- 1) States: coordinates of queens on board
- 2 Initial state: empty board
- ③ Goal state: test that all queens are on the board and do not attack each other
- 4 Search space size: $(n \times n)^n$

queens initially assigned to columns:

- States: row number of each queen
- Initial state: empty board
- 3 Goal state: test that all queens are on the board and do not attack each other
- ④ Search space size: nⁿ

BFS

DFS

- Expand shallowest node in the frontier
- Expand deepest node in the frontier

Sac

BFS

- Expand shallowest node in the frontier
- FIFO (queue)

- DFS
- Expand deepest node in the frontier

イロト イロト イヨト イヨト

LIFO (stack)

Sac

BFS

- Expand shallowest node in the frontier
- FIFO (queue)
- Complete for finite *b* (search space can be infinite)

DFS

- Expand deepest node in the frontier
- LIFO (stack)
- Complete only for finite search spaces

< ロト < 同ト < ヨト < ヨト

BFS

- Expand shallowest node in the frontier
- FIFO (queue)
- Complete for finite *b* (search space can be infinite)
- Optimal for uniform cost edges (example?)

DFS

- Expand deepest node in the frontier
- LIFO (stack)
- Complete only for finite search spaces

< ロト < 同ト < ヨト < ヨト

Not optimal (example?)
 Not optimal

BFS

- Expand shallowest node in the frontier
- FIFO (queue)
- Complete for finite *b* (search space can be infinite)
- Optimal for uniform cost edges (example?)
- Time: $\mathcal{O}(b^d)$
- Space: $\mathcal{O}(b^d)$

DFS

- Expand deepest node in the frontier
- LIFO (stack)
- Complete only for finite search spaces

< ロト < 同ト < ヨト < ヨト

- Not optimal (example?)
 Not optimal
- Time: $\mathcal{O}(b^d)$
- Space: $\mathcal{O}(bm)$

DFS

DFS

Like BFS, but:

- g(n) lowest path cost from root to n
- Frontier implemented as priority queue g
- Goal test performed when a node is **selected**
- Test if a better path is find to a node in the frontier

- Heuristic function h(n) is an estimate of the distance from n to goal g
- if h(n) = 0 for all n, we get Dijkstra
- h(n) should be calculated quickly, ideally in $\mathcal{O}(1)$

Heuristic functions

Definition

h(n) is <u>admissible</u> if for all nodes $n, 0 \le h(n) \le p^*(n)$, where p^* is the length of a shortest path from n to g.

Definition

h(n) is monotonous if $h(n) \le h(n') + c(n, n')$, for all nodes n and edges (n, n')

Exercises

Decide whether the following heuristics are admissible and monotonous for a traffic network (cities and roads).

- Euclidean distance: $h(n) = \sqrt{(g_1 n_1)^2 + (g_2 n_2)^2}$
- Manhattan metric: $h(n) = |g_1 n_1| + |g_2 n_2|$
- Maximum metric: $h(n) = \max\{|g_1 n_1|, |g_2 n_2|\}$

Heuristic functions

Proposition

All monotonous heuristics are also admissible.

Exercise

Find a heuristic function that is admissible, but not monotonous.

Sac

イロト イロト イヨト イヨト

Heuristic functions

Summary

	Compl.*	Opt.	Time	Space	Node selection
BFS	Yes	Yes	$\mathcal{O}(b^d)$	$\mathcal{O}(b^d)$	FIFO
DFS	No	No	$\mathcal{O}(b^m)$	$\mathcal{O}(bm)$	LIFO
Dijkstra	Yes	Yes	$\mathcal{O}(b^{1+\mathcal{C}^*/\epsilon})$	$\mathcal{O}(b^{1+\mathcal{C}^*/\epsilon})$	f(n) = g(n)
Best FS	No	No	$\mathcal{O}(b^m)$	$\mathcal{O}(b^m)$	f(n) = h(n)
A*	Yes	Yes**	depends	depends	f(n) = g(n) + h(n)

 C^* is the cost of an optimal solution

- ϵ smallest action (edge) cost
- * depends on assumptions about the state space
- ** depends on heuristic
