

# Winter road maintenance in the Czech Republic

Jiří Fink

Department of Theoretical Computer Science and Mathematical Logic  
Faculty of Mathematics and Physics  
Charles University in Prague

April 29, 2025

## Winter road maintenance in the Czech Republic

Create plans for maintenance vehicles removing snow from roads.

## Winter road maintenance in the Czech Republic

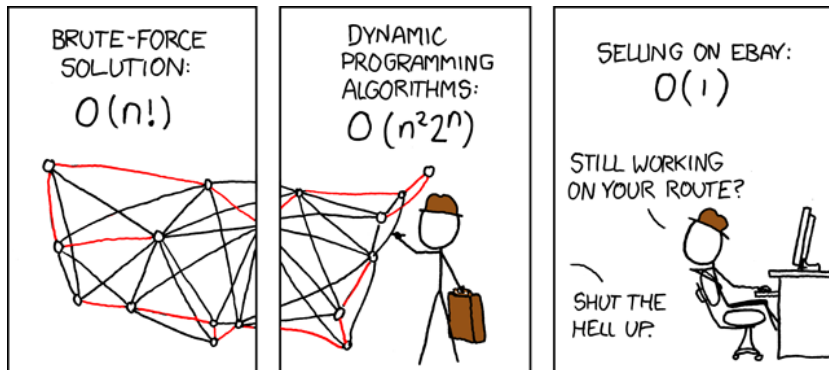

Create plans for maintenance vehicles removing snow from roads.

## Capacitated Vehicle Routing Problem

- Packages of given weights have to be delivered from a depot.
- Cars have limited capacity and have to return to the depot.
- The goal is to minimize the total length of all routes.

# Seven Bridges of Königsberg (Euler, 1736)

Source: [https://en.wikipedia.org/wiki/Seven\\_Bridges\\_of\\_Konigsberg](https://en.wikipedia.org/wiki/Seven_Bridges_of_Konigsberg)

## Input

- A graph  $(V, E)$
- A depot  $g \in V$
- Demand  $d_e$  and traversing cost  $c_e$  for every edge  $e \in E$
- A set  $C$  of cars with capacity  $K$

## Input

- A graph  $(V, E)$
- A depot  $g \in V$
- Demand  $d_e$  and traversing cost  $c_e$  for every edge  $e \in E$
- A set  $C$  of cars with capacity  $K$

## Feasible solutions

- Every car has assigned a closed tour starting at the depot
- Every edge is serviced by one car
- The total demand of serviced edges of each car is at most car's capacity

# Capacitated Arc Routing Problem (Golden, Wong, 1981)

## Input

- A graph  $(V, E)$
- A depot  $g \in V$
- Demand  $d_e$  and traversing cost  $c_e$  for every edge  $e \in E$
- A set  $C$  of cars with capacity  $K$

## Feasible solutions

- Every car has assigned a closed tour starting at the depot
- Every edge is serviced by one car
- The total demand of serviced edges of each car is at most car's capacity

## Objective

Minimize the total cost which is the sum of all costs of traversed edges over all cars

# Practical motivation of our problem

## Complexity

Capacitated Arc Routing Problem is strongly NP-hard. Related problems are

- Knapsack, Bin Packing, 3-partitioning, and
- Steiner Tree Problem.

## Complexity

Capacitated Arc Routing Problem is strongly NP-hard. Related problems are

- Knapsack, Bin Packing, 3-partitioning, and
- Steiner Tree Problem.

## Theorem (Golden, Wong, 1981)

$\frac{3}{2}$ -approximation is NP-hard even if all demands are equal to one.

## Complexity

Capacitated Arc Routing Problem is strongly NP-hard. Related problems are

- Knapsack, Bin Packing, 3-partitioning, and
- Steiner Tree Problem.

## Theorem (Golden, Wong, 1981)

$\frac{3}{2}$ -approximation is NP-hard even if all demands are equal to one.

- Different road priorities
- Cars cannot make U-turn at some crossroads
- More constraints at mountains
- ...

## Objectives

- Maximize social happiness
- Minimize number of cars
- Minimize deadheads

## The most difficult step in practice

Obtain all data

## Every road has to be serviced in both directions

### Observation

Every connected graph contain a tour traversing every edge in both direction exactly once.

# Every road has to be serviced in both directions

## Observation

Every connected graph contain a tour traversing every edge in both direction exactly once.

## Proof

- The statement holds for trees
- For general graph, use a spanning tree

# Every road has to be serviced in both directions

## Observation

Every connected graph contains a tour traversing every edge in both directions exactly once.

## Proof

- The statement holds for trees
- For general graph, use a spanning tree

## Goal

- Cover edges by connected subgraphs
- Every subgraph contains a depot
- Every subgraph has limited length of edges

- Used to create an initial solution
- Choose an uncovered edge that is the most distant from any covered edge
- Attach the edge to the closest subgraph with a sufficient remaining capacity
- Create a new subgraph in the closest depot if necessary

## Variants of local search

- **Local search** algorithms move from solution to solution by applying local changes, until a solution deemed optimal is found or a time bound is elapsed.
- For a **very large-scale neighborhood search**, the neighborhood is large and its needs to be explored systematically.
- **Problem size reduction methods** optimally solves some subproblem while the rest of solution is preserved.

## Variants of local search

- **Local search** algorithms move from solution to solution by applying local changes, until a solution deemed optimal is found or a time bound is elapsed.
- For a **very large-scale neighborhood search**, the neighborhood is large and its needs to be explored systematically.
- **Problem size reduction methods** optimally solves some subproblem while the rest of solution is preserved.

## Knapsack

- Every subgraph is stored as a tree.
- Two trees sharing a common vertex  $u$  can exchange subtrees.
- For two trees, consider all common vertices and all combinations of subtrees.
- Using knapsack, minimize the size of one tree while preserving the capacity of the second tree.
- If two trees are small enough, merge them into one.

### Input size

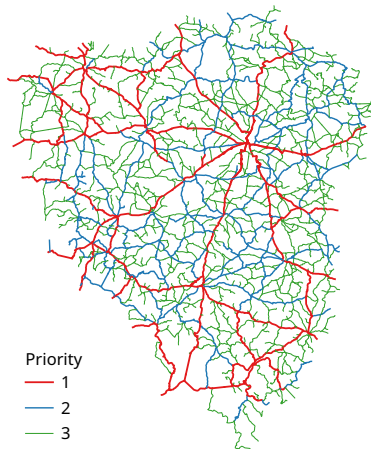

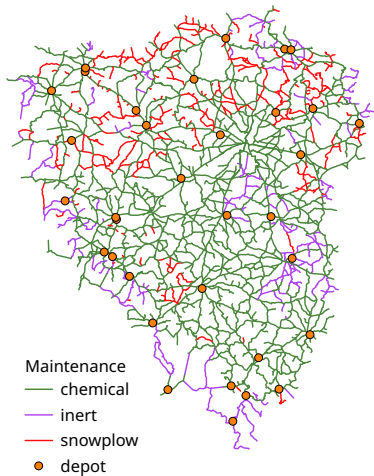

- 1719 vertices
- 2280 edges
- 34 depots

### Input size

- 1719 vertices
- 2280 edges
- 34 depots

### Length of roads in kilometers

<b>maintenance/priority</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>sum</b>
